

Factors to Consider About **AdvanTex® Wastewater Treatment Systems**

- The most widely used packed-bed filter system for onsite use in the country. The technology is adapted from the long-proven recirculating sand filter technology.
- The wastewater treatment system selected and installed on the first building in the nation to receive the Platinum Award from the National Green Building Council.
- Approved and permitted by local Health Departments in NC for flows up to 3,000 GPD.
- Effluent from all NC systems average 5 BOD and 6 TSS.
- Low operating costs – no moving parts, no power hungry blowers, no potential for sewage bypass.
- Passed rigorous National Sanitation Foundation Treatment Standard 40 testing -- the only packed-bed filter system to ever do so.
- Meets both NC Treatment Standards I and II.
- No media to replace, it uses a non-woven textile that will last as long as the facility it services.
- Equipped with a telemetry control panel that supports remote monitoring and management by the operator – our objective is for systems operations and maintenance to be completely transparent to the property owner.
- We provide technical support to designers, facilitate the permitting process, oversee construction and hold the Operations and Maintenance contract.
